Primary Ear and Hearing Care Training Resource Elsevier España

A book such as this one is needed but does not exist. There is no book with a scope encompassing all clinically important auditory evoked responses. *Binaural Interference* F.A. Davis  
Clinical Masking Procedures provides the most comprehensive discussion of the topic currently available, presenting a theoretical foundation of masking that is essential for the understanding of applied clinical techniques. A strong foundation in the underlying concepts enables the clinician to make well informed decisions when selecting a specific approach and in

applying and modifying the appropriate procedure. The goal of this book is to facilitate an understanding of the decision-making process required for clinical masking through problem-solving techniques. An entire chapter is devoted to clinical masking procedures using insert earphones, a current (and future) trend that has achieved increasing popularity over the past few years. Chapter 9 consists of a group of case studies, each of which includes a series of audiograms that takes the reader step-by-step from the initial audiological results through the completed audiological evaluation.

Although half of all deafness and hearing impairment is avoidable, an estimated 278 million people worldwide are living with

disabling hearing impairment (moderate or worse level of hearing loss in the better hearing ear). Many more have mild hearing loss and/or ear diseases. One quarter of hearing impairment begins during childhood, and 80% of all deaf and hearing impaired people live in low and middle income countries. These problems can be life-long and sometimes life-threatening; they may have profound effects on: inter-personal communication, education, employment prospects, social relationships and through stigmatization. They produce substantial economic burdens on countries. Some of the most effective and cost-effective interventions against ear and hearing problems can be implemented at the primary level by trained primary ear and hearing care (PEHC) workers or primary health care (PHC) workers or their equivalents. Used on a large scale, these interventions will have a major impact on the burden of ear

disease and hearing loss. However most developing countries do not have PEHC workers and the topic is hardly addressed in the training of PHC workers. The Primary Ear and Hearing Care Training Resource manuals provide practical information and guidance and can be used as part of a training course, stand-alone training module or in a self-taught manner. They are designed to be useful to a wide range of primary health care personnel. The manuals can also be used to help communities understand common causes of deafness and hearing impairment and ways to prevent and/or treat the conditions.

The Acoustic Reflex discusses the acoustic reflex - its magnitude in differential diagnosis, threshold, latency, and other related topics. The book covers different topics such as the neurophysiological basis of the acoustic middle-ear reflex and

its characteristics; impedance concepts relating to it; and theories of middle-ear muscle function. The text also encompasses the evaluation of the response time of acoustic-immittance instruments; the contralateral acoustic-reflex threshold and its application for prediction of hearing loss; the magnitude and growth of the acoustic; the ipsilateral acoustic reflex; and the acoustic reflex latency. The monograph is recommended for clinicians and researchers in audiology, deaf education, hearing science, neurology, otolaryngology, physiology, and psychology. The book will also serve as a reference text in a course on impedance.
