Water is a finite and non-substitutable resource. As the foundation of life, societies and economies, it carries multiple values and benefits. But unlike most other natural resources, it has proven extremely difficult to determine its true 'value'. The 2021 edition of the United Nations World Water Development Report, titled "Valuing Water" assesses the current status of and challenges to the valuation of water across different sectors and perspectives and identifies ways in which valuation can be promoted as a tool to help improve its management and achieve global sustainable development.

The fresh, clean taste of New York's water is legendary. Less well known is the fascinating story of the massive program of exploration and construction that was required to achieve such purity. The story of that monumental undertaking is told in *Water-Works* and illustrated with an astonishing archive of drawings and photographs documenting the design and construction of dams, reservoirs, aqueducts, and tunnels. This complex system brings millions of gallons of water to the city every day from rivers many hundreds of miles away. Kevin Bone, Gina Pollara, Paul Deppe, and students from the Irwin S. Chanin School of Architecture of the Cooper Union spent nine years cataloging and preserving this remarkable archive, which is held by the City of New

York Department of Environmental Protection. Essays by Bone, former DEP commissioner Albert F. Appleton, and scholars Peter H. Gleick and Gerard Koepfel trace the history of the system from its beginnings in the mid-1800s to the current construction of City Water Tunnel #3. The story of New York's water system is illuminated in expert detail on the pages of *Water-Works*, revealing the beauty and power of these magnificent works of public architecture and engineering.

In the quest to reduce costs and improve the efficiency of water and wastewater services, many communities in the United States are exploring the potential advantages of privatization of those services. Unlike other utility services, local

governments have generally assumed responsibility for providing water services. Privatization of such services can include the outright sale of system assets, or various forms of public-private partnerships—from the simple provision of supplies and services, to private design construction and operation of treatment plants and distribution systems. Many factors are contributing to the growing interest in the privatization of water services. Higher operating costs, more stringent federal water quality and waste effluent standards, greater customer demands for quality and reliability, and an aging water delivery and wastewater collection and treatment infrastructure are all challenging municipalities that may be short of funds or technical capabilities. For municipalities with limited capacities to meet these challenges, privatization can be a viable alternative. Privatization of Water Services evaluates the fiscal and policy implications of privatization, scenarios in which privatization works best, and the efficiencies that may be gained by contracting with private water utilities.

This volume traces the evolution of the concept of Public Health and reveals the importance of political will and public spending in this field of civil engineering. Design, construction, operation and maintenance of water-supply and main drainage works are discussed. The period covered extends from Roman engineering through to the early 20th century, with examples from Europe, America and Japan.

From its 1908 beginnings, the history of drinking water chlorination is a compelling subject with controversy that surprises the modern reader. This thorough but accessible science-history book provides the dramatic details on the reduction of waterborne illness and how “the most significant public health advance of the millennium” came to pass.

In this book, visual and poetic emblems of God’s love, created by Otto van Veen and Jeanne Guyon, symbolically represent spiritual meaning and, as such, offer a gift of revealed strength and purpose to the aware reader. In our age, when love seems almost forgotten, this emblem book uniting Guyon’s poetry and D’Othon Vaenius’s illustrations give us a faithful look into what might be. What if Divine love becomes part of the human endeavor and joins to human souls? Otto van Veen and Jeanne de la Mothe Guyon internalized this hope and here reveal to us their vision of the love of God bonding and becoming one with the human soul. Translated into English for the first time here, these emblems of divine love become available to postmodern readers.

Remote sensing has been used for water management purposes over the years. This book describes the combination of satellite imagery, in-situ spectroradiometric data and radar techniques for the identification of water leakages in the water supply network in both rural and urban areas in Cyprus. This book presents a holistic approach combining new technologies for a complete system of water distribution network leakage detection management, by combining Global Navigation Satellite Systems (GNSS), Geographical Information Systems (GIS), Satellite Remote Sensing techniques as well Geophysical surveys such as ground penetrating radar (GPR), Unmanned Aerial Vehicles (UAV) and spectro-radiometric measurements, which can be used to effectively identify and monitor water leakages.

Empire of Water Oxfam

Most of the technological developments relevant to water supply and wastewater date back to more than to five thousand years ago. These developments were driven by the necessity to make efficient use of natural resources, to make

civilizations more resistant to destructive natural elements, and to improve the standards of life, both at public and private level. Rapid technological progress in the 20th century created a disregard for past sanitation and wastewater and stormwater technologies that were considered to be far behind the present ones. A great deal of unresolved problems in the developing world related to the wastewater management principles, such as the decentralization of the processes, the durability of the water projects, the cost effectiveness, and sustainability issues, such as protection from floods and droughts were intensified to an unprecedented degree. New problems have arisen such as the contamination of surface and groundwater. Naturally, intensification of unresolved problems has led to the reconsideration of successful past achievements. This retrospective view, based on archaeological, historical, and technical evidence, has shown two things: the similarity of physicochemical and biological principles with the present ones and the advanced level of wastewater engineering and management practices. Evolution of Sanitation and Wastewater Technologies through the Centuries presents and discusses the major achievements in the scientific fields of sanitation and hygienic water use systems throughout the millennia, and compares the water technological developments in several civilizations. It provides valuable insights into ancient wastewater and stormwater management technologies with their apparent characteristics of durability, adaptability to the environment, and sustainability. These technologies are the underpinning of modern achievements in sanitary engineering and wastewater management practices. It is the best proof that “the past is the key for the future”. Evolution of Sanitation and Wastewater Technologies through the Centuries is a textbook for undergraduate and graduate courses of Water Resources, Civil Engineering, Hydraulics, Ancient History, Archaeology, Environmental Management and is also a valuable resource for all researchers in these fields. the United States and several countries in North Africa and the Middle East. The papers examined constraints to agricultural production as it relates to water scarcity; focusing on 1) the state of the science regarding water management for agricultural purposes in the Middle East and North Africa 2) how science can be applied to better manage existing water supplies to optimize the domestic production of food and fiber. The cross-cutting themes of the workshop were the elements or principles of science-based decision making, the role of the scientific community in ensuring that science is an integral part of the decision making process, and ways to improve communications between scientists and decision makers.

Supplying water to millions is not simply an engineering and logistical challenge. As David Soll shows in his finely observed history of the nation's largest municipal water system, the task of providing water to New Yorkers transformed the natural and built environment of the city, its suburbs, and distant rural watersheds. Almost as soon as New York City completed its first municipal water system in 1842, it began to expand the network, eventually reaching far into the Catskill Mountains, more than one hundred miles from the city. *Empire of Water* explores the history of New York City's water system from the late nineteenth century to the early twenty-first century, focusing on the geographical, environmental, and political repercussions of the city's search for more water. Soll vividly recounts the profound environmental implications for both city and countryside. Some of the region's most prominent landmarks, such as the High Bridge across the Harlem River, Central Park's Great Lawn, and the Ashokan Reservoir in Ulster County, have their origins in the city's water system. By

tracing the evolution of the city's water conservation efforts and watershed management regime, Soll reveals the tremendous shifts in environmental practices and consciousness that occurred during the twentieth century. Few episodes better capture the long-standing upstate-downstate divide in New York than the story of how mountain water came to flow from spigots in Brooklyn and Manhattan. Soll concludes by focusing on the landmark watershed protection agreement signed in 1997 between the city, watershed residents, environmental organizations, and the state and federal governments. After decades of rancor between the city and Catskill residents, the two sides set aside their differences to forge a new model of environmental stewardship. His account of this unlikely environmental success story offers a behind the scenes perspective on the nation's most ambitious and wide-ranging watershed protection program.

Awaken one...awaken them all. Insomniac Piper Laurel focuses on the simple things, the feel-good things. She likes her coffee black, her wine cheap, and her men gone by morning. But when her last living relative dies, she must confront the feel-bad things. She's the last Laurel, she's almost thirty, and she's completely alone. When she returns to her sleepy seaside hometown, her ex is still as yummy as ever, and a familiar-seeming stranger is also there to tug at her heartstrings. But a love triangle isn't the only thing waiting for her. The immortal Anik has spent centuries plotting to claim the last Laurel--and a lot of innocent souls in the bargain. To survive Anik and the Realm Wars, Piper must forget her version of reality and awaken to her destiny as a Seekin, Guardian of Souls. With two men

vying for her heart and hellhounds on her heels, Piper must decide who she trusts and who she loves while embracing her destiny with her eyes wide open.

This volume approaches the history of water in the Iberian Peninsula in a novel way, by linking it to the ongoing international debate on water crisis and solutions to overcome the lack of water in the Mediterranean. What water devices were found? What were the models for these devices? How were they distributed in the villas and monastic enclosures? What impact did hydraulic theoretical knowledge have on these water systems, and how could these systems impact on hydraulic technology? Guided by these questions, this book covers the history of water in the most significant cities, the role of water in landscape transformation, the irrigation systems and water devices in gardens and villas, and, lastly, the theoretical and educational background on water management and hydraulics in the Iberian Peninsula between the sixteenth and the nineteenth centuries.

Historiography on water management in the territory that is today Spain has highlighted the region's role as a mediator between the Islamic masters of water and the Christian world. The history of water in Portugal is less known, and it has been taken for granted that is similar to its neighbour. This book compares two countries that have the same historical roots and, therefore, many similar stories, but at the same time, offers insights into particular aspects of each country. It is recommended for scholars and researchers interested in any field of history of the early modern period and of the nineteenth century, as well as general readers interested in studies on the Iberian Peninsula, since it was the role model for many settlements in South America, Asia and Africa.
